DETAILED ACTION

Response to Arguments

1. In view of the appeal brief filed on 1/13/03, PROSECUTION IS HEREBY REOPENED. A new grounds of rejection is set forth below.

To avoid abandonment of the application, appellant must exercise one of the following two options:

(1) file a reply under 37 CFR 1.111 (if this Office action is non-final) or a reply under 37 CFR 1.113 (if this Office action is final); or,

(2) request reinstatement of the appeal.

If reinstatement of the appeal is requested, such request must be accompanied by a supplemental appeal brief, but no new amendments, affidavits (37 CFR 1.130, 1.131 or 1.132) or other evidence are permitted. See 37 CFR 1.193(b)(2).

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Phung et al. (6,370,469 B1) and in further view of Blaney (4,522,280 A).

Phung et al. discloses a microcontroller system 104 for altering the condition of a cruise control system 100 for a motorized vehicle when the vehicle experiences lateral

acceleration in excess of a threshold value, said lateral acceleration being determined by a sensor (or accelerometer) 106, as recited in column 1, lines 11-47. Phung et al. does not disclose the control system as disengaging the cruise control based on the sensed value exceeding the threshold value. Blaney does disclose a control device for disengaging a cruise control in response to a sensed value exceeding a threshold value, as recited in column 2, lines 65-69. It would have been to one having ordinary skill in the art at the time of the invention to have provided the control system of Phung et al. with the disengagement option of Blaney in order to prevent unwanted acceleration of the vehicle in an emergency situation.

With respect to claims 2-5, the control system of Phung et al. and Blaney can be applied to any type of vehicle, further, type of vehicle the system is applied to is an intended use and therefore has been given little patentable weight.

With respect to claim 17, the method recited in this claim is inherently performed in the use of the control system of Phung et al. and Blaney, as described above.
